## **Technologies and Strategies Employed by Cooper and Alley**

Cooper and Alley utilize a multifaceted array of technologies to address various pollutants, including particulate matter (PM), sulfur dioxide (SO<sub>2</sub>), nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOCs), and hazardous air pollutants (HAPs). Their strategies are tailored to specific industries and emission sources, emphasizing efficiency and environmental sustainability.

### **Electrostatic Precipitators (ESPs)**

Electrostatic precipitators are highly effective in removing particulate matter from industrial flue gases. They operate by charging particles electrically and then collecting them on oppositely charged plates. Cooper and Alley optimize ESP designs to enhance collection efficiency while minimizing energy consumption. Advantages: - High removal efficiency for fine particles - Suitable for large-volume emissions - Durable and low-maintenance Limitations: - Less effective for gaseous pollutants - Require significant initial capital investment

### **Scrubbers and Wet Collection Systems**

Scrubbers are employed primarily for removing acid gases like SO<sub>2</sub> and HCl, as well as certain airborne particulates. Wet scrubbers use a liquid—often water or a chemical solution—to absorb or neutralize pollutants. Types include: - Limestone Scrubbers: Utilize calcium carbonate to neutralize sulfuric acid. - Venturi Scrubbers: Use high-velocity water sprays for particulate removal. - Absorber Towers: Incorporate chemical reagents for specific pollutant removal. Advantages: - Highly effective for acid gases - Can be combined with other systems for comprehensive control Limitations: - Generate wastewater requiring treatment - Potential for corrosion and operational complexity

## **Selective Catalytic Reduction (SCR) for NO<sub>x</sub> Control**

SCR technology involves injecting ammonia or urea into the flue gas, which reacts in the presence of a catalyst to convert NO<sub>x</sub> into nitrogen and water. Advantages: - Very high reduction efficiency (>90%) - Adaptable to various industrial applications Limitations: - Requires precise temperature control - Catalyst deactivation over time

## **VOCs and HAPs Control Technologies**

For volatile organic compounds and hazardous air pollutants, Cooper and Alley implement activated carbon adsorption, thermal oxidizers, and biofiltration systems. - Activated Carbon Adsorption: Uses activated carbon beds to trap VOCs effectively. - Thermal Oxidizers: Combust VOCs at high temperatures to convert pollutants into benign gases. - Biofiltration: Employs microorganisms to degrade VOCs biologically.
