Overview of Skin Diseases in Clinical Dermatology

Understanding skin diseases requires familiarity with their classification, common presentations, and underlying mechanisms. Skin diseases are broadly categorized based on their pathogenesis and clinical appearance into inflammatory, infectious, neoplastic, genetic, and autoimmune conditions.

Inflammatory Skin Diseases

Inflammatory skin diseases are characterized by skin inflammation often presenting with redness, swelling, heat, pain, and sometimes vesiculation or scaling. They are among the most common dermatologic conditions encountered in clinical practice.

Atopic Dermatitis (Eczema)

Clinical Features

- Usually begins in childhood but can occur at any age. - Characterized by pruritic, erythematous, and scaly patches. - Commonly affects flexural areas such as the antecubital and popliteal fossae. - Chronic cases show lichenification and skin thickening.

Pathogenesis

- Multifactorial; involves genetic predisposition, skin barrier dysfunction, immune dysregulation. - Increased IgE levels and eosinophilia are often observed.

Diagnosis and Management

- Diagnosis based on clinical features; skin biopsy may show spongiosis. - Management includes:

1. Emollients to restore skin barrier
2. Topical corticosteroids for inflammation
3. Antihistamines for pruritus
4. In severe cases, systemic immunosuppressants or biologics

Psoriasis Vulgaris

Clinical Features

- Well-demarcated, erythematous plaques with silvery scales. - Commonly affects extensor surfaces, scalp, and nails. - Auspitz sign: pinpoint bleeding when scales are scraped.

Pathogenesis

- Immune-mediated; involves T-cell activation and cytokine release. - Hyperproliferation of keratinocytes leads to thickened plaques.

Diagnosis and Management

- Diagnosis is primarily clinical; histopathology shows acanthosis, parakeratosis. - Management options:

1. Topical agents: corticosteroids, vitamin D analogs
2. Phototherapy
3. Systemic therapies: methotrexate, cyclosporine, biologics (e.g., TNF-alpha inhibitors)

Contact Dermatitis

Clinical Features

- Erythematous, edematous, and pruritic lesions. - May develop vesicles or bullae in acute phases. - Distribution correlates with exposure to the offending agent.

Pathogenesis

- Allergic contact dermatitis involves a Type IV hypersensitivity reaction. - Irritant contact dermatitis results from direct skin damage.

Diagnosis and Management

- Patch testing aids in identifying allergens. - Management includes:

1. Avoidance of irritants/allergens
2. Topical corticosteroids
3. Barrier protection with emollients
4. Systemic corticosteroids in severe cases

Infectious Skin Diseases

Infectious skin conditions are caused by bacteria, viruses, fungi, or parasites, often presenting with characteristic lesions and patterns.

Impetigo

Clinical Features

- Superficial bacterial infection, predominantly caused by *Staphylococcus aureus* or *Streptococcus pyogenes*. - Presents with honey-colored crusted erosions, mainly around the nose and mouth. - Common in children.

Diagnosis and Management

- Diagnosis is clinical; bacterial culture may be performed. - Treatment includes:

1. Topical antibiotics like mupirocin
2. Or systemic antibiotics in extensive cases

Herpes Simplex Virus (HSV) Infection

Clinical Features

- Recurrent vesicular eruptions on erythematous base. - Commonly affects lips (cold sores) or genital area. - Prodromal tingling or burning sensation often precedes lesions.

Pathogenesis

- HSV establishes latency in nerve ganglia, with periodic reactivation.

Diagnosis and Management

- Diagnosis via clinical features; PCR and viral culture are confirmatory. - Treatment includes:

1. Antiviral agents: acyclovir, valacyclovir
2. Suppression therapy in recurrent cases

Fungal Infections

Superficial Mycoses

- Includes dermatophyte infections such as tinea corporis, tinea pedis, and tinea capitis. - Presents with annular, erythematous plaques with central clearing.

Deep Mycoses

- Less common but more severe; can involve subcutaneous tissues or internal organs.

Diagnosis and Management

- Diagnosis via KOH preparation, fungal culture. - Management involves topical or systemic antifungal agents like terbinafine or griseofulvin.

Neoplastic Skin Diseases

Neoplastic diseases encompass benign and malignant tumors arising from various skin components.

Basal Cell Carcinoma (BCC)

Clinical Features

- Pearly, translucent papules with telangiectasia. - Often ulcerates or develops into a rodent ulcer.

Pathogenesis

- Linked to UV radiation exposure; mutations in PTCH1 gene.

Diagnosis and Management

- Biopsy confirms diagnosis. - Treatment options:

1. Curettage and electrodesiccation
2. Mohs micrographic surgery
3. Topical imiquimod or 5-fluorouracil for superficial lesions

Melanoma

Clinical Features

- Asymmetrical pigmented lesions with irregular borders. - ABCDE criteria: Asymmetry, Border irregularity, Color variation, Diameter >6mm, Evolution.

Pathogenesis

- Melanocyte malignancy, often associated with genetic mutations and UV exposure.

Diagnosis and Management

- Dermoscopy improves diagnostic accuracy. - Biopsy with wide excision is definitive. - Management includes surgical excision, sentinel lymph node biopsy, and targeted therapies or immunotherapy for advanced cases.

Autoimmune and Connective Tissue Diseases

These conditions involve immune system targeting skin components, leading to characteristic lesions.

SLE (Systemic Lupus Erythematosus)

Clinical Features

- Malar (butterfly) rash across cheeks and nose. - Photosensitivity, mucous membrane ulcers.

Pathogenesis

- Autoantibody formation resulting in immune complex deposition.

Diagnosis and Management

- Serological markers: ANA, anti-dsDNA. - Management includes immunosuppressants, hydroxychloroquine, and photoprotection.

Scleroderma

Clinical Features

Management

- Symptomatic; no cure. - Includes vasodilators, immunosuppressants, and physical therapy.

Genetic Skin Disorders

Genetic conditions often present with distinctive features and may involve multiple organ systems.

Ichthyosis

Clinical Features

- Dry, scaly, fish-like skin. - Variants include ichthyosis vulgaris and congenital ichthyosiform erythroderma.

Pathogenesis
