Sample Solved Surveying Problems and Solutions

Here, we present a selection of solved problems across categories to illustrate effective approaches and solutions.

1. Chain Surveying Problem

Problem: A chain of 30 meters is used to measure a boundary. The measured length is 30 m, but due to slack, the actual length is 30.2 m. Calculate the corrected length if the chain was slightly elongated by 0.1%. Solution: - Elongation = 0.1% of 30.2 m = $0.0001 \times 30.2 = 0.00302$ m - Corrected length = measured length - elongation = $30.2 \text{ m} - 0.00302 \text{ m} \approx 30.19698 \text{ m}$ Answer: The corrected boundary length is approximately 30.197 meters.

2. Compass Surveying Problem

Problem: Traverse ABCD has bearings: - AB = 100 m, bearing N 30° E - BC = 150 m, bearing S 45° E - CD = 120 m, bearing S 30° W - DA = 130 m, bearing N 60° W Calculate the closing error and adjust the bearings accordingly. Solution: - Convert bearings to azimuths. - Calculate the coordinates of each point. - Determine the closing error in East and North directions. - Adjust bearings proportionally. Due to the complexity, detailed calculations involve coordinate geometry and are typically handled with

plotting or software.

3. Levelling Problem

Problem: The staff reading at station A is 2.5 m, and at station B, 4.2 m. The instrument is located at station A, and the instrument height is 1.5 m. Find the elevation of station B. Solution: - Height of B = Staff reading at B + height of instrument - Staff reading at A = $4.2 \text{ m} - 2.5 \text{ m} + 1.5 \text{ m} = 3.2 \text{ m}$ Assuming elevation of A is known or set as zero.

In-Depth Review of Selected Surveying Problems and Solutions

Given the vast number of problems, this section highlights representative examples across categories, illustrating key concepts and analytical approaches.

Example 1: Distance Measurement Using Chain Surveying

Problem Statement: Measure a distance between two points separated by a rugged terrain using chain surveying, accounting for potential sag and tension errors.

Solution Approach: - Use a steel chain of known length, ensuring it is properly tensioned. - Correct for sag by applying a correction factor based on chain tension and length. - Calculate the true distance by adding the correction to the measured chain length. - Analyze potential errors and recommend multiple measurements for accuracy. **Analytical Insight:** The problem underscores the importance of understanding instrument calibration and error correction, emphasizing that simple measurements require careful adjustments for precision.

Example 2: Horizontal Angle Calculation with Theodolite

Problem Statement: Determine the true bearing of a line using a theodolite, with observed angles affected by instrument

errors. Solution Approach: - Measure angles at two stations with theodolite, recording multiple readings for each. - Compute the mean of the readings to minimize random errors. - Correct for instrument errors such as collimation error and index error. - Use the corrected angles to determine bearings via the method of relative bearings. **Analytical Insight:** This problem highlights the importance of error correction in angular measurements and demonstrates how multiple observations improve reliability.

Example 3: Leveling and Elevation Difference Calculation

Problem Statement: Find the elevation difference between two points using differential leveling over a hilly terrain.

Solution Approach: - Conduct foresight and

backsight readings at successive points. - Calculate the difference in elevation by subtracting the foresight from the backsight. - Adjust for curvature and refraction if the distance exceeds certain thresholds. - Verify the closure error and distribute it proportionally if necessary.

Analytical Insight: Accurate leveling requires meticulous reading, correction for environmental factors, and error analysis to ensure data reliability.

Example 4: Traverse Computation and Adjustment

Problem Statement: Given a closed traverse with measured angles and distances, compute the coordinates of each station, adjusting for measurement errors. Solution Approach: - Calculate the approximate coordinates using the given
