Advantages and Disadvantages

| Advantages | Disadvantages | ||| | Produces strong, high-quality pulp | Higher chemical consumption and effluent generation | | Suitable for a wide range of raw materials | More energy-intensive than mechanical pulping |

Semichemical and Other Processes

Semichemical pulping combines chemical and mechanical treatments, balancing yield and fiber quality. Other specialized processes include chemi-mechanical and thermo-

mechanical pulping, tailored for specific end-use requirements.

Papermaking Techniques

Preparation of Pulp

Pulp is conditioned with additives like sizing agents, fillers, and retention aids to improve paper properties before forming.

Paper Formation

The core of papermaking involves forming a uniform sheet from pulp slurry.

1. **Fourdrinier Machine:** The most common continuous process, where pulp slurry is deposited on a moving wire mesh
2. **Cylinder (Conical) Machine:** Used for producing thicker paper and cardboard
3. **Other methods:** Rotary and twin-wire formers for specialized products

Dewatering and Pressing

After formation, water is removed through pressing and initial drying, increasing sheet density and strength.

Drying and Finishing

The paper sheet undergoes:

1. Hot pressing to smooth surfaces
2. Drying via steam-heated cylinders
3. Calendering for gloss and surface finish
4. Cutting, coating, and packaging for final products
