His research and publications have laid the foundation for modern understanding of vehicle stability, maneuverability, and energy efficiency. Wong's theories integrate classical mechanics, control theory, and materials science to address complex problems in vehicle design. **Fundamental Principles of Ground Vehicle Theory** Ground vehicle dynamics are governed by a

set of core principles that describe how vehicles respond to driver inputs, environmental conditions, and design parameters.

Newton's Laws and Vehicle Motion

The motion of ground vehicles is primarily analyzed through Newton's laws of motion:

- First Law (Inertia): A vehicle remains at rest or in uniform motion unless acted upon by external forces.
- Second Law ($F=ma$): The acceleration of a vehicle is proportional to the net force acting upon it and inversely proportional to its mass.
- Third Law: For every action, there is an equal and opposite reaction, relevant in tire-road interactions.

Tire-Road Interaction

A critical aspect of ground vehicle theory involves understanding tire-road contact mechanics:

- Friction: The primary force enabling traction and vehicle control.
- Slip Ratio: The difference between wheel rotational speed and vehicle speed, affecting acceleration and braking.
- Cornering Forces: Lateral forces generated during turns, influenced by tire properties and vehicle speed.

Vehicle Dynamics Models

Several models are used to simulate and analyze vehicle behavior:

- Bicycle Model: Simplifies a four-wheel vehicle into two wheels for ease of analysis.
- Point Mass Model: Assumes the vehicle as a single point to analyze linear motion.
- Full-Scale Multi-Body Models: Incorporate detailed representations of each component for precise simulations.
