Overview of Kepler's Laws of Planetary Motion

Kepler's Laws, formulated by Johannes Kepler in the early 17th century, describe the motion of planets around the Sun. These three laws laid the groundwork for Newton's law of universal gravitation and remain fundamental in astrophysics today.

Kepler's First Law: The Law of Ellipses

- Statement: Each planet moves around the Sun in an elliptical orbit, with the Sun at one focus. - Implication: Orbits are not perfect circles but ellipses, which means the distance between the planet and the Sun varies throughout the orbit. - Visualization: The Gizmo allows students to observe the shape of planetary orbits and see how the Sun's position at one focus of the ellipse affects the orbit's eccentricity.

Kepler's Second Law: The Law of Equal Areas

- Statement: A line segment joining a planet and the Sun sweeps out equal areas during equal intervals of time. - Implication: Planets move faster when they are closer to the Sun (perihelion) and slower when farther away (aphelion). - Visualization: In the Gizmo, students can track the sweeping of areas over time and see the relationship between orbital speed and position.

Kepler's Third Law: The Law of Harmonies

- Statement: The square of the orbital period (T) of a planet is proportional to the cube of the semi-major axis (a) of its orbit: $T^2 \propto a^3$. - Implication: There is a predictable relationship between how long a planet takes to orbit the Sun and its average distance from it. - Visualization: The

Gizmo helps students compare orbital periods and distances for different planets or satellites, reinforcing this mathematical relationship.
